

1 Short Answers

Note 5

In each part below, provide the number/equation and brief justification.

- (a) A connected planar simple graph has 5 more edges than it has vertices. How many faces does it have?

- (b) How many edges need to be removed from a 3-dimensional hypercube to get a tree?

- (c) The Euler's formula $v - e + f = 2$ requires the planar graph to be connected. What is the analogous formula for planar graphs with k connected components?

2 Always, Sometimes, or Never

Note 5

In each part below, you are given some information about a graph G . Using only the information in the current part, say whether G will always be planar, always be non-planar, or could be either. If you think it is always planar or always non-planar, prove it. If you think it could be either, give a planar example and a non-planar example.

- (a) G can be vertex-colored with 4 colors.

- (b) G requires 7 colors to be vertex-colored.

(c) $e \leq 3v - 6$, where e is the number of edges of G and v is the number of vertices of G .

(d) G is connected, and each vertex in G has degree at most 2.

(e) Each vertex in G has degree at most 2.

3 Hypercubes

Note 5

The vertex set of the n -dimensional hypercube $G = (V, E)$ is given by $V = \{0, 1\}^n$ (recall that $\{0, 1\}^n$ denotes the set of all n -bit strings). There is an edge between two vertices x and y if and only if x and y differ in exactly one bit position.

(a) Draw 1-, 2-, and 3-dimensional hypercubes and label the vertices using the corresponding bit strings.

(b) Show that the edges of an n -dimensional hypercube can be colored using n colors so that no pair of edges sharing a common vertex have the same color.

(c) Show that for any $n \geq 1$, the n -dimensional hypercube is bipartite.

4 Triangular Faces

Note 5 Suppose we have a connected planar graph G with v vertices and e edges such that $e = 3v - 6$. Prove that in any planar drawing of G , every face must be a triangle; that is, prove that every face must be incident to exactly three edges of G .
